### Forecasted Kansas Winter Wheat Production Down 5 Percent

The 2010 Kansas wheat crop is forecast at 352.6 million bushels as of June 1<sup>st</sup>, up 2 percent from the May 1<sup>st</sup> forecast, but down 5 percent from the 2009 crop. The current crop is projected to be harvested from 8.2 million acres, down 600,000 acres from a year ago. Yield per harvested acre is expected to average 43 bushels, up 1 bushel from the May forecast and the 2009 final yield. If realized, this would be the highest yield since 2003.

Temperatures during May were cooler than normal during the middle of the month, but then warmed to above normal levels the last week of the month. The State received widespread rainfall the middle two weeks of May with some

areas receiving hail. At the start of May, wheat progress was near normal, but the cooler temperatures and rainfall caused the crop to fall behind. Crop condition rated as good to excellent, declined 11 points during May, but was still 13 points above last year. Farmers are concerned about barley yellow dwarf, powdery mildew, and rust affecting the wheat. Topsoil moisture remained good throughout the month and was rated 92 percent adequate to surplus by the end of the month, compared to 76 percent last year.

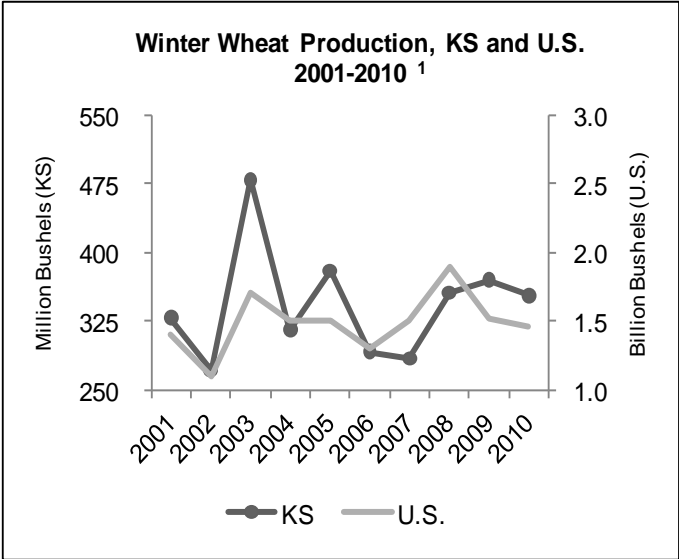

### U.S. Winter Wheat Production Down Slightly from May

**Winter wheat** production is forecast at 1.48 billion bushels, up 2 percent from the May 1 forecast but 3 percent below 2009. Based on June 1 conditions, the United States yield is forecast at 46.6 bushels per acre, up 0.7 bushel from last month and 2.4 bushels more than last year. Expected area for harvest as grain or seed totals 31.8 million acres, unchanged from May 1.

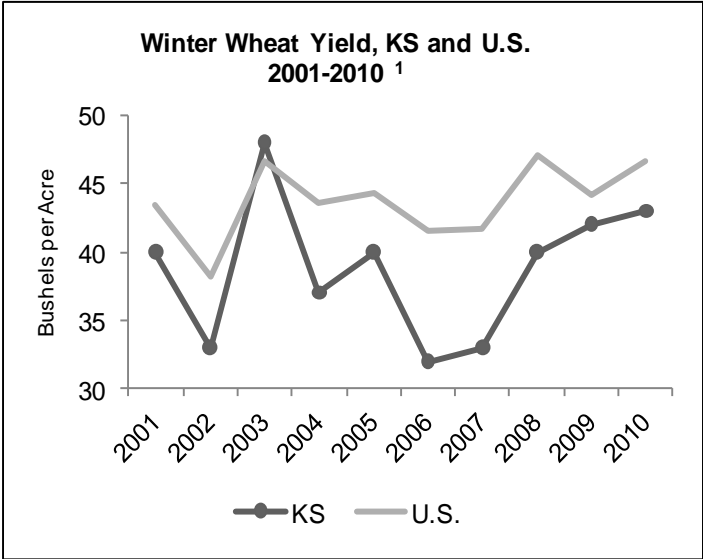

Hard Red production is up 2 percent from a month ago to 979 million bushels. Soft Red production is up slightly from last month and now totals 284 million bushels. White production totals 219 million bushels, up 2 percent from last month. Of the White production total, 17.3 million bushels are Hard White and 202 million bushels are Soft White.
